TASK 19 / 25

Enterprise Grade · Expert

Sprint D - Enterprise Readiness · Mastery 90%

Focus

Build the enterprise reporting and configuration analytics: prove value to the customer and tune their setup.

What to build / complete

- Enterprise-facing reporting (funnel, quality, time-to-hire, ROI)
- Analysis of how a tenant's configuration affects their outcomes
- Benchmarks that help the customer improve

Execution — work through in order

Phase 3 gives you a goal and a bar, not a recipe. These stages are the discipline; the design decisions are yours to make and defend.

Stage A — Understand & set the bar

1. Re-read the Expected Output and the scoring parameters so you build to the bar, not past it.
2. Confirm every prerequisite and upstream input is actually in your hands, not merely promised.
3. Restate, in one sentence, what 'good' means here: An enterprise customer can see the value they got and what to change to get more.

Stage B — Build: Enterprise-facing reporting (funnel, quality, time-to-hire, ROI)

1. Define the metric, its source & the decision

Define precisely what “Enterprise-facing reporting (funnel, quality, time-to-hire, ROI)” measures, which raw events it depends on, and which decision it changes. No decision, no metric.

2. Build the query/model on real data

Build the query/model on real production data — sampled if you must, but never synthetic.

3. Validate: reconcile, sanity-check, quantify uncertainty

Reconcile against a source system, sanity-check the magnitude, and state the uncertainty honestly.

4. Tie every number to an action & defend it

For every number, be ready to say where it came from and what action it triggers. Undefendable numbers do not ship.

Stage C — Build: Analysis of how a tenant's configuration affects their outcomes

1. Define the metric, its source & the decision

Define precisely what “Analysis of how a tenant's configuration affects their outcomes” measures, which raw events it depends on, and which decision it changes. No decision, no metric.

2. Build the query/model on real data

Build the query/model on real production data — sampled if you must, but never synthetic.

3. Validate: reconcile, sanity-check, quantify uncertainty

Reconcile against a source system, sanity-check the magnitude, and state the uncertainty honestly.

4. Tie every number to an action & defend it

For every number, be ready to say where it came from and what action it triggers. Undefendable numbers do not ship.

Stage D — Build: Benchmarks that help the customer improve

1. Define the metric, its source & the decision

Define precisely what “Benchmarks that help the customer improve” measures, which raw events it depends on, and which decision it changes. No decision, no metric.

2. Build the query/model on real data

Build the query/model on real production data — sampled if you must, but never synthetic.

3. Validate: reconcile, sanity-check, quantify uncertainty

Reconcile against a source system, sanity-check the magnitude, and state the uncertainty honestly.

4. Tie every number to an action & defend it

For every number, be ready to say where it came from and what action it triggers. Undefendable numbers do not ship.

Stage E — Integrate, verify & make demoable

1. Wire your work into the end-to-end flow and run the whole journey once, start to finish.
2. Present the enterprise report as the customer would receive it and defend every number.
3. Break it on purpose: force the failure path and confirm it degrades the way you designed.
4. Prepare a live demo on real data. Not slides, not screenshots, not 'it works on my machine'.

Done when (demoable by end of task)

- “Enterprise-facing reporting (funnel, quality, time-to-hire, ROI)” is complete, real, and demoable end-to-end.
- “Analysis of how a tenant's configuration affects their outcomes” is complete, real, and demoable end-to-end.
- “Benchmarks that help the customer improve” is complete, real, and demoable end-to-end.
- Good looks like: An enterprise customer can see the value they got and what to change to get more.

Worry if any of these are true

- Enterprise reports with no ROI number.
- Benchmarks with no recommended action.
- Calling an experiment early because it looked good on day two.

Hand-off

- Enterprise reporting to Frontend. Make sure the next person can pick it up without you.
